VELOOP Rewards – Frontend Development Task Assignment

Task 16 – Complete Level-Up Dashboard Redesign

Project: Gamified Level Progression, Rewards s Engagement Hub

Existing Page Reference

Current Level Dashboard:
VELOOP Rewards – Level Dashboard

Use the existing page to understand the current data and functionality. The existing page is **only a reference**.

- **Critical Requirement**

Do NOT copy, clone, or simply restyle the existing Level Dashboard.

The complete page must be **re-developed with a completely new UI, layout, information architecture, and interaction concept.**

The new page should feel like a **premium gamified progression center** where users have a reason to return, level up, play, earn, and unlock rewards.

---

1. Project Objective

The current Level Dashboard should be transformed into a much more engaging:

Level-Up + Rewards + Games + Earning Hub

The user should immediately understand:

Where am I now?
→ Current Level

How far have I progressed?
→ Current XP

What do I need next?
→ XP required for next level

What will I receive?
→ Next-level reward

What level comes next?
→ Level 1 → Level 2 → Level 3 → etc.

What can I do right now?
→ Play games / complete earning activities

Why should I return?
→ Next level + rewards + new earning opportunities

---

2. Core Design Philosophy

The new page must feel:

- Premium
- Modern
- Gamified
- Reward-focused
- Fintech-inspired
- Trustworthy
- Interactive
- Engaging
- Motivating
- Sophisticated

The goal is **premium gamification**, not a childish gaming interface.

Think:

Fintech dashboard + achievement system + reward progression + mini-game hub

---

3. ι **STRICT REQUIREMENT – Add a Game Area**

A **game-type engagement area MUST be included on this page.**

This is not optional.

The purpose is to give users something engaging to do while progressing toward their next level.

The game area should allow users to:

Play → Engage → Earn eligible rewards → Progress

---

4. Game Area Concept

Create a dedicated section such as:

Play s Earn

or

Level-Up Arcade

or

Reward Games

You can create a better name.

The area should contain at least **one playable mini-game concept**.

---

5. Game Ideas

You are encouraged to create an original game.

Possible concepts:

Option 1 – Catch the Coins

Users move a character/object and collect falling VE coins.

Option 2 – Reward Memory

Match reward cards to earn a small reward.

Option 3 – Tap Challenge

Complete a timed interaction challenge.

Option 4 – Lucky Box

Select one of several reward boxes.

Option 5 – VE Sprint

Complete a short skill-based challenge to unlock a reward opportunity.

Option 6 – Daily Puzzle

Complete a simple puzzle and receive an eligible reward.

These are only examples.

Creativity is strongly encouraged.

You may create an entirely different game if it fits VELOOP Rewards better.

6. Game Reward Requirement

The game should have a reward concept.

Possible rewards:

- VEs
- SVEs
- Gems
- Tokens
- XP

Use **dummy values for development** unless official reward values are provided.

Example:

Complete the challenge → **+20 XP**

or:

Score 80+ → **+25 VEs**

These must be clearly treated as development/demo values until the actual reward rules are approved.

---

7. Game Rules

The game must clearly explain:

- How to play
- Objective
- Time/attempt limit if applicable
- Reward
- Score
- Eligibility
- How often the user can play

Do not create hidden mechanics.

If the game is only a UI prototype, clearly separate the prototype logic from future backend reward logic.

---

8. Game Result State

After completing the game, show a rewarding result.

Create a visually satisfying but premium reward reveal.

G. Main Level Hero

The top of the page should immediately communicate the user's current progression.

Possible heading:

Level Up Your Rewards

Supporting text:

Keep earning XP, unlock new levels, and discover better rewards along the way.

You may create better copy.

---

10. Current Level

Make the current level one of the most prominent elements.

Example:

Current Level

Level 04

Include:

- Level badge
- Level number
- Level name
- XP
- Progress

---

11. Current XP

Display:

Current XP

Example:

6,420 XP

Use the actual user value when connected to the backend.

---

12. XP Progress

Create a highly visual progress indicator.

Example:

Level 04

6,420 / 8,000 XP

 80%

1,580 XP remaining

The progress should animate subtly when the page loads.

---

13. XP Required for Next Level

Clearly display:

XP Needed

1,580 XP

or:

1,580 XP to Level 05

This is one of the most important pieces of information.

The user should never have to calculate it themselves.

---

14. Next Level

Clearly show:

Next Level

Level 05

You can visually show:

Level 04 → Level 05

Current Next

or create a progression path.

---

15. Next-Level Reward

This should be a major element of the page.

Display:

Next Level Reward

Example:

500 VEs

or:

20 Gems

or a combination of supported rewards.

Use actual reward data if available.

If the backend does not yet provide the reward, use clearly labelled dummy data.

---

16. Reward Reveal

Make the next-level reward visually exciting.

Possible:

- Reward chest
- Locked reward card
- Glowing badge
- Gift box
- Premium vault
- Floating VE/Gem assets

The user should feel:

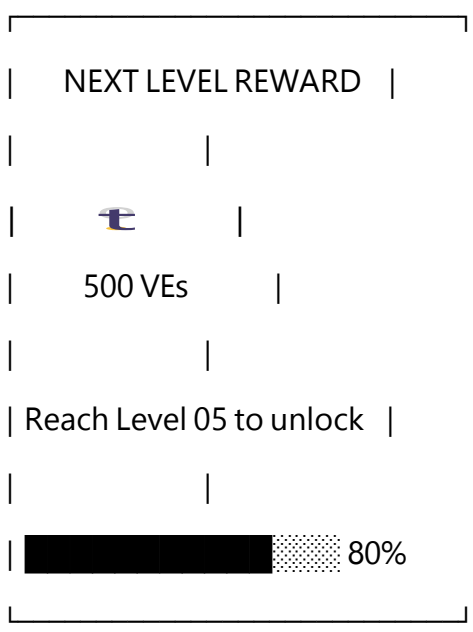

"I want to reach the next level to unlock this."

---

17. Locked Reward Concept

A strong idea is to show the next reward as partially locked.

Example:

This creates anticipation without misleading the user.

---

18. Level Roadmap

Create a visual progression system.

Example:

LEVEL 01

|

↓

LEVEL 02

|

↓

LEVEL 03

|

↓

LEVEL 04 ← YOU ARE HERE

|

↓

LEVEL 05

|

↓

LEVEL 06

The visual can be much more creative than this.

1G. Multiple Levels

The dashboard should allow users to understand upcoming progression.

Show:

Current

Level 04

Next

Level 05

Future

Level 06

Potentially show additional future levels if the system supports them.

---

20. Level States

Create clear visual states.

Completed Level

✓ Completed

Current Level

You Are Here

Next Level

Next Goal

Locked Future Level

🔒 Locked

---

21. Level Rewards Roadmap

Consider showing rewards along the progression.

Example:

Level 03

✓ 100 VEs

Level 04

✓ 10 Gems

Level 05

🔒 500 VEs

Level 06

🔒 2 Spins

Use actual rewards where available.

Otherwise use development placeholders.

---

22. Earning Features Section

- **STRICT REQUIREMENT**

Add a dedicated:

Earn More XP s Rewards

section.

This should give users actionable ways to progress toward the next level.

---

23. New Earning Features

The page must include **new/expanded earning opportunities** under the Level-Up dashboard.

Possible concepts:

Watch s Earn

Complete eligible ad-watching activities.

Daily Tasks

Complete daily activities.

Refer s Earn

Invite friends and earn eligible rewards/XP.

Play s Earn

Complete the mini-game.

Daily Challenge

Complete a daily challenge.

Bonus Missions

Complete a special mission.

Streak XP

Maintain engagement streaks.

Only implement actual earning mechanisms that are approved by the product team.

For new concepts, clearly mark them as:

Coming Soon

until they are officially supported.

---

24. Earning Feature Cards

Create interactive cards.

Example:

```
┌──────────────────────────┐
| Daily Challenge      |
|                  |
```

| Earn up to +50 XP |

| |

| Complete today's mission |

| |

| [Start Challenge →] |

└──────────────────────────┘

---

25. Progress-to-Next-Level CTA

The page should always provide an obvious next action.

Example:

1,580 XP left

Ways to reach your next level

Then show:

- Play
- Watch
- Complete
- Refer
- Earn

This converts the page from a passive dashboard into an **action hub**.

---

26. Personalized Recommendation

A strong optional feature:

Recommended for You

Example:

You're only 320 XP away from Level 05.

Complete one more challenge to reach your next level.

This can dynamically change based on the user's progress.

---

27. Level-Up Celebration

When the user reaches the next level, create a premium celebration state.

Example:

LEVEL UP!

LEVEL 05

+500 VEs Reward

Achievement Unlocked

[Continue]

Use subtle animation.

Avoid excessive confetti.

---

28. Level-Up Animation

Possible effects:

- Badge reveal
- XP bar completion
- Level number transition
- Reward chest opening
- Coins moving into wallet
- Subtle particles

The animation should feel like an achievement.

2G. XP History

If useful, add:

Recent XP Activity

Example:

+20 XP

Referral

+50 XP

Daily Task

+100 XP

Watch C Earn

+25 XP

Game Challenge

This helps users understand how they are progressing.

If XP history does not currently exist, this can be proposed as an optional future feature.

---

30. XP Sources

Where applicable, clearly show where XP comes from.

Possible categories:

- Tasks
- Referrals
- Games
- Streaks
- Daily bonuses
- Challenges

Do not invent official XP amounts.

31. Level Information

Add an [i] information icon.

Example:

XP helps you progress through VELOOP Rewards levels. As you reach new levels, you may unlock additional rewards and experiences according to the platform's level system.

---

32. Reward Information

Use an [i] icon beside the next-level reward.

Explain:

The displayed reward is associated with the next level according to the current reward configuration.

Keep the wording transparent.

---

33. Fintech Design Direction

Although the page is gamified, it must still look like a trusted rewards/fintech product.

Use:

- Premium cards
- Strong typography
- Controlled gradients
- Sophisticated illustrations
- Clean statistics
- Subtle animations
- Clear hierarchy

Avoid:

- Casino aesthetics
- Neon colors
- Flashing effects
- Excessive cartoon styling

- Cheap gaming UI
- Rainbow gradients

---

34. Background

Maintain the project-wide body background:

#161827

All components should complement this background.

---

35. Color Direction

Recommended:

- Deep navy
- Gold
- Silver
- White
- Soft blue
- Warm yellow
- Muted purple
- Subtle green

Use colors strategically to represent:

- Current
- Completed
- Locked
- Reward
- Progress

---

36. Illustration Requirement

Use meaningful illustrations.

Possible:

Level Progression

A character climbing a reward tower.

XP

A glowing XP orb.

Rewards

A premium reward chest.

Game

A character interacting with the mini-game.

Earning

Coins flowing toward a wallet.

The illustrations should help explain the feature.

---

37. Responsive Requirements

The complete Level Dashboard must work on:

Mobile

320px+

Tablet

768px+

Laptop

1280px+

Desktop

1440px+

Large Screens

1920px+

---

38. Mobile Layout

Do not simply shrink the desktop design.

Recommended hierarchy:

Level Hero

↓

Current XP

↓

Next Level Reward

↓

Level Roadmap

↓

Play C Earn

↓

Earn More XP

↓

XP Activity

The exact order can be changed based on your UX concept.

3G. Desktop Layout

A possible desktop composition:

```
┌──────────────────────────────┬──────────────────────┐
| Current Level + XP           | Next Reward          |
| Progress                     | Locked Reward        |
├──────────────────────────────┴──────────────────────┤
| Level Progression Roadmap                          |
├──────────────────────────────┬──────────────────────┤
| PLAY C EARN                  | XP Activity          |
| Mini Game                    |                      |
├──────────────────────────────┴──────────────────────┤
| EARN MORE XP C REWARDS                             |
└─────────────────────────────────────────────────────┘
```

This is only a reference.

Create a better composition if possible.

---

40. Empty States

Create meaningful empty states.

No XP Activity

Your XP journey starts here.

CTA:

Start Earning XP →

No Available Game

If the game is temporarily unavailable:

New challenge coming soon.

---

41. Loading States

Design skeleton/loading states for:

- Current level
- XP
- Next reward
- Level roadmap
- Game
- Earning features

---

42. Error State

Example:

Unable to Load Level Progress

We couldn't load your level information right now.

CTA:

Try Again

Do not display raw API/server errors.

---

43. Interaction Requirements

The page should include meaningful interactions.

Examples:

XP Bar

Animated on page load.

Level Cards

Hover reveals additional information.

Reward

Hover/reveal interaction.

Game

Interactive playable area.

Earning Cards

Hover → CTA emphasis.

Level Roadmap

Click → display level details if supported.

---

44. Game Prototype Requirement

For the game area, the intern should create a **functional frontend mini-game**, not just a static image.

The game should have:

- Start state
- Gameplay
- Score/progress
- Completion state
- Reward result
- Reset/replay state

Backend reward processing is not required unless already available.

Use local state for the prototype.

---

45. Game Example

One possible concept:

VE Coin Catch

A short 20-second challenge.

The user controls a collector.

Coins appear.

The user collects them.

At the end:

Score: 82

Reward:

+25 XP

[Play Again]

This is only an example.

You are encouraged to create something more creative.

---

46. Game Safety s Trust

Do not design the mini-game as:

- Gambling
- Betting
- Casino
- Jackpot

It should be a **skill/engagement-based reward experience**.

The interface should remain consistent with VELOOP Rewards.

---

47. New Earning Ideas

You may propose new earning concepts such as:

Daily Mission

Complete one mission.

XP Challenge

Complete a specific activity.

Reward Hunt

Find hidden reward elements around the platform.

Quick Quiz

Answer a few questions.

Engagement Challenge

Complete a set of eligible activities.

Referral Mission

Reach a referral milestone.

Weekly Quest

Complete a weekly objective.

If these are not currently supported, present them as:

Concept / Coming Soon

rather than implying they already exist.

---

48. Technology Stack

Use:

- **React.js**
- **Vite**
- **Bootstrap**
- **CSS Modules (.module.css)**
- **React Hooks**

- **React Icons**
- **Lucide React**
- Other relevant React libraries where appropriate

4G. Component Architecture

Suggested:

src/

|

├── components/

| ├── LevelHero/

| ├── CurrentLevel/

| ├── XPProgress/

| ├── NextLevelReward/

| ├── LevelRoadmap/

| ├── LevelRewardCard/

| ├── PlayAndEarn/

| | ├── GameContainer/

| | ├── GameStart/

| | ├── GamePlay/

| | ├── GameResult/

| | └── Game.module.css

| |

| ├── EarnMoreXP/

| ├── XPActivity/

| ├── LevelInfo/

| └── LevelUpModal/

|

├── pages/

| └── LevelDashboard/

|

├── data/

├── hooks/

├── assets/

└── styles/

Use reusable components rather than one large page component.

---

50. Data Architecture

Keep level/reward configuration separate from the UI.

Example:

{

currentLevel: 4,

currentXP: 6420,

nextLevel: 5,

requiredXP: 8000,

nextLevelReward: {

type: "VEs",

amount: 500

}

}

These are example values only.

The structure should be designed so backend data can replace them easily.

---

51. Dummy Data

If backend data isn't available during development, use dummy values for:

- Current XP

- Current level
- Next level
- XP required
- Reward
- Game score
- Game reward
- XP history
- Earning opportunities

Clearly treat these as **development/demo data**.

---

52. Local Development Requirement

The complete Level-Up Dashboard must first be developed and tested on your **local system**.

Required process:

1. Visit the existing Level Dashboard.
2. Understand current data/functionality.
3. Plan a completely new concept.
4. Develop the Level Dashboard locally.
5. Implement XP progression.
6. Implement next-level rewards.
7. Implement level roadmap.
8. Build the mandatory mini-game.
9. Build earning feature cards.
10. Implement animations.
11. Implement loading/error/empty states.
12. Test all responsive layouts.
13. Fix console errors.
14. Create production build.

15. Push to GitHub.
16. Deploy.
17. Test the live route.

---

53. GitHub Requirement

Push the complete project to GitHub.

Repository should contain:

- Source code
- React components
- CSS Modules
- Game components
- Assets
- Data
- README.md
- Configuration files

Do not upload:

- node_modules
- .env
- API keys
- Passwords
- Sensitive credentials

---

54. Deployment Requirement

Deploy using:

- **Vercel**, or
- **Netlify**

Vercel is recommended.

Verify:

/Lvl-Dashboard

works correctly after deployment.

---

55. README.md Requirement

The README must contain:

- Project Overview
- Level System
- XP System
- Next-Level Rewards
- Game Concept
- Game Rules
- Earning Features
- Technology Stack
- Installation
- Development Commands
- Folder Structure
- Component Architecture
- Responsive Behavior
- Animation Details
- Screenshots
- Live Demo
- GitHub Repository
- Author

---

56. Final Deliverables

1. GitHub Repository

Complete source code.

2. Live Deployment

Vercel/Netlify URL.

3. README.md

Complete documentation.

4. Screenshots / Demo

Include:

- Desktop Level Dashboard
- Tablet version
- Mobile version
- Current Level
- XP progress
- Next Level
- Next Level Reward
- Level Roadmap
- Game start
- Game gameplay
- Game result
- Earning features
- XP activity
- Level-up celebration
- Loading state
- Empty state
- Error state

---

57. Submission Checklist

Level System

- Current Level displayed
- Current XP displayed
- XP required for next level displayed

- Next Level clearly shown
- Next Level Reward displayed
- Level progression created
- Current level highlighted
- Future levels represented
- Locked states created
- Level-up state created

Game

- Game area included
- Functional frontend mini-game
- Start state
- Gameplay state
- Score/progress
- Reward result
- Replay/reset
- Game is engaging
- Game does not resemble gambling/casino
- Reward/XP concept included

Earning

- Earn More XP section
- Multiple earning opportunities
- Interactive earning cards
- Existing supported earning routes preserved
- New concepts clearly marked if not yet implemented

UX

- Loading state
- Empty state
- Error state

- Information tooltips
- Animations
- Responsive layout
- Accessibility

Technical

- React.js
- Vite
- Bootstrap
- CSS Modules
- React Hooks
- React Icons/Lucide
- Local development completed
- GitHub repository updated
- README.md completed
- Vercel/Netlify deployment completed
- Live /Lvl-Dashboard tested

---

58. Project Timeline s Submission Deadline

To ensure smooth project execution and timely review:

Project Assigned On:	Today when its assigned
Duration:	20 – 24 days from its assigned date
Submission Time:	**5:30 P.M. (IST)**

Final Product Goal

The new **Level-Up Dashboard should NOT be just a page showing "Level 4 – 6,420 XP."**

It should become a **reason for the user to return to VELOOP Rewards**.

The experience should communicate:

"You are here."

→ Current Level

"This is how far you've come."

→ Current XP

"This is where you're going."

→ Next Level

"This is what you'll unlock."

→ Next-Level Reward

"This is how you can get there faster."

→ Earning Features

"And here's something fun to do right now."

→ Play C Earn Game

The ideal loop is:

Play → Earn XP → Progress → Unlock Reward → Level Up → Discover New Opportunities → Return

Most Important Requirements

1. **Completely new UI/UX — do not copy the existing Level Dashboard.**
2. **Current XP, XP required, next level, and next-level reward must be clearly visible.**
3. **A functional mini-game/Play s Earn area is mandatory.**
4. **Additional earning opportunities must be included.**
5. **The experience must be premium, trusted, modern, fintech-inspired and reward-focused.**
6. **Gamification should motivate users without making VELOOP Rewards look like a casino or cheap gaming platform.**
7. **All existing data/functionality must be preserved unless explicitly changed.**

Design attached below!!

Reference: https://ve-loop-client.vercel.app/Lvl-Dashboard

I want the functionality like this and the designed is attached also copy the badges

DESIGN IS ATTACHED JUST BUILD THE SAME AND MAKE IT RESPONSIVE
